

* 600

«FRESH H₂O OR BRACKISH??!»
* Long shot idea: is the grey mud Mazama ash deposited by storms transporting ash from up base
Lower section of interbedded peat and mud unit.

* grey mud: (Ag²⁺ As²⁻ Dg⁺)
darker peaty mud: (Si²⁻ Dg⁺ Ag⁺ As⁺)

* 610

5-10mm

mud color is similar (S₁ S_{1/2}) to the muds in intertidal units found in Sikes R. cores; alternatively this could be redeposited Mazama ash (?)

Fresh water (below) to brackish marsh trans

(S_h 2 Ag⁺ Dg⁺ As⁺)

620

muddy peat to peaty mud with abundant coarse detrital organics including twigs, bark like material, possible roots or fine rhizomes

the texture is poorly layered; more peaty units appear to be deposited horizontally in thin 1-5mm thick discont. layers or packages. There are not noticeable clay/silt layers (ges) as are observed in the lake deposits above.

Interp: these sediments represent marsh deposits, perhaps intertidal or freshwater ponding micropal. analysis.

630

(S_h 2 + Ag⁺ Dg⁺ As⁺)
